

Pulsar Element

PULSAR

The Pulsar is a direct copy of the Palm 1.0, which is illegally using our patented heating technology.

- 1 Pulsar Element vaporizer.
- 2 Illegal use of Magic-Flight's patented heating technology.
- 3 Inserted battery comes into contact with heat conductive rods, heating technology patented by Magic-Flight.
- 4 Pulsar kit comes in a silver tin with manual, a plastic brush, (2) 2000mAh batteries, and a white charger.

•The US 8488952 B2 patent protects the design principles of the Magic-Flight Launch Box vaporizer, and states that the current configuration of these principles demonstrated in the MFLB are only one possible form. Other configurations of vaporizers that appear to be different, such as the Pulsar Element, are still infringing upon the patent by using a fine mesh heat conductive screen surface with a 3-D, trench-like shape, similar heating technology with conductive rods connected to screen, and other design specifics. The included instructions take care to not use the same terminology as the Launch Box. For an in-depth definition of the intellectual properties covered, the patent can be viewed at mflb.it/patent.

Function: The stiff push back ring in battery chamber makes it tiring to hold down battery for proper pressure. Once engaged and heated, the device becomes hot to hold in hand. The white charger that comes in the Pulsar Element kit, is the same cheap charger found other known counterfeit kits.
